

Medium chain lengths should be crossed on the double pulley assembly as shown.

Slide medium chain through pulley before attaching to double pulley assembly.

Pulley #3

Lifting Hook #4

1. Some castings have a separate lifting eye(#1). If you have one of these kits, assemble as shown.
2. Glue lifting hook (#4) to pulley (#3).
3. Glue one end of the very fine chain to each side of the single pulley on the hoist assembly (#2).
4. At this point, you may need to temporarily hang your hoist on the jib boom and measure the height you will need your lifting hook to be.
5. Cut the medium chain to 2 times the height you will need. Glue one end to a side of the double pulley on the hoist. Slide the free end through the lifting pulley. Now glue the free end to the diagonally opposite end of the double pulley as shown in the diagram.
6. Glue both ends of the spare medium chain as shown. Hang hoist on jib.
