

## NÁVOD / INSTRUCTION Ju 88D-2/4

1/48

### Historie

Vývoj Junkers Ju 88 byl zahájen v roce 1935 podle požadavků Říšského ministerstva letectví. První prototyp Ju 88V-1 vzletl již v roce 1936. Byl navržen jako rychlý taktický bombardér. Vývoj byl poměrně dlouhý, zkušební stroje Ju 88A-0 byly dodány k testovací jednotce Erprobungskommando 88 na jaře 1939. První sériová verze Ju 88A-1 s menším rozpětím byly brzy nahrazeny ve výrobě verzemi s novým křídlem s větším rozpětím Ju 88A-5 a Ju 88A-4. A-4 dostala i výkonnější verzi motorů Jumo 211. Záhy se ukázalo, že konstrukce Ju 88 velmi adaptabilní. Bylo možné ji snadno upravit podle potřeb k různým účelům. Podle požadavků Luftwaffe byly vyrobeny Ju 88 ve verzích pro bombardování, denní nebo noční stíhání, bitevní a protitankové verze a v neposlední řadě verze pro průzkum. Vhodnost pro průzkumné akce si Luftwaffe ověřila na několika Ju 88A-5(F) a Ju 88D-0 upravených montáží kamer do zadní části pumovnice, přídavných nádrží do její přední části a odstranění aerodynamických brzd ze spodní části křídla. Na základě verze Ju 88A-4 byly stavěny Ju 88D-1 a tropikalizovaná D-3. Verze Ju 88A-5 se stala základem průzkumných verzí Ju 88D-2 a tropikalizovaných D-4. U průzkumných jednotek většinou nahradily starší Dornيري Do 17. Luftwaffe nasadila své průzkumné Ju 88D na východě i západě na všech frontách od polárního kruhu až po písek Afriky. Průzkumné Ju 88D byly dodány i německým spojencům, Maďarsku a Rumunsku. Oba německé satelity je nasadily na východní frontě, po přechodu Rumunska na stranu spojenců byly dokonce nasazeny proti Wehrmachtu. Několik strojů bylo ukořistěno a testováno spojenci. Celkem bylo vyrobeno více než 1450 ks všech verzí Ju 88D.

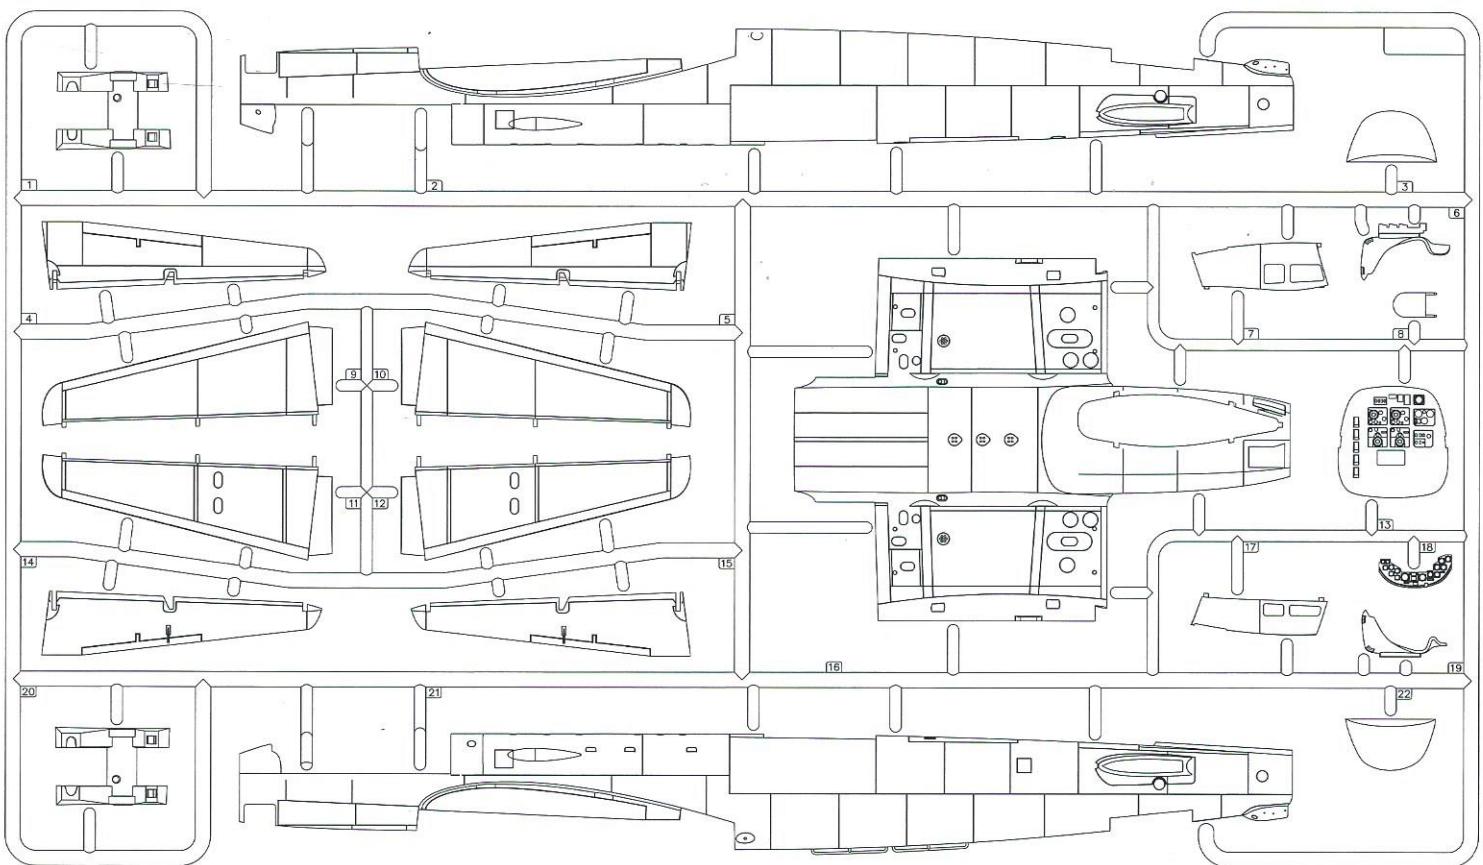

Rozpětí: 20.08 m, délka: 14.39 m, max. rychlosť: 470 km/h, dostup: 8 200m, dolet: 1790 km

### History

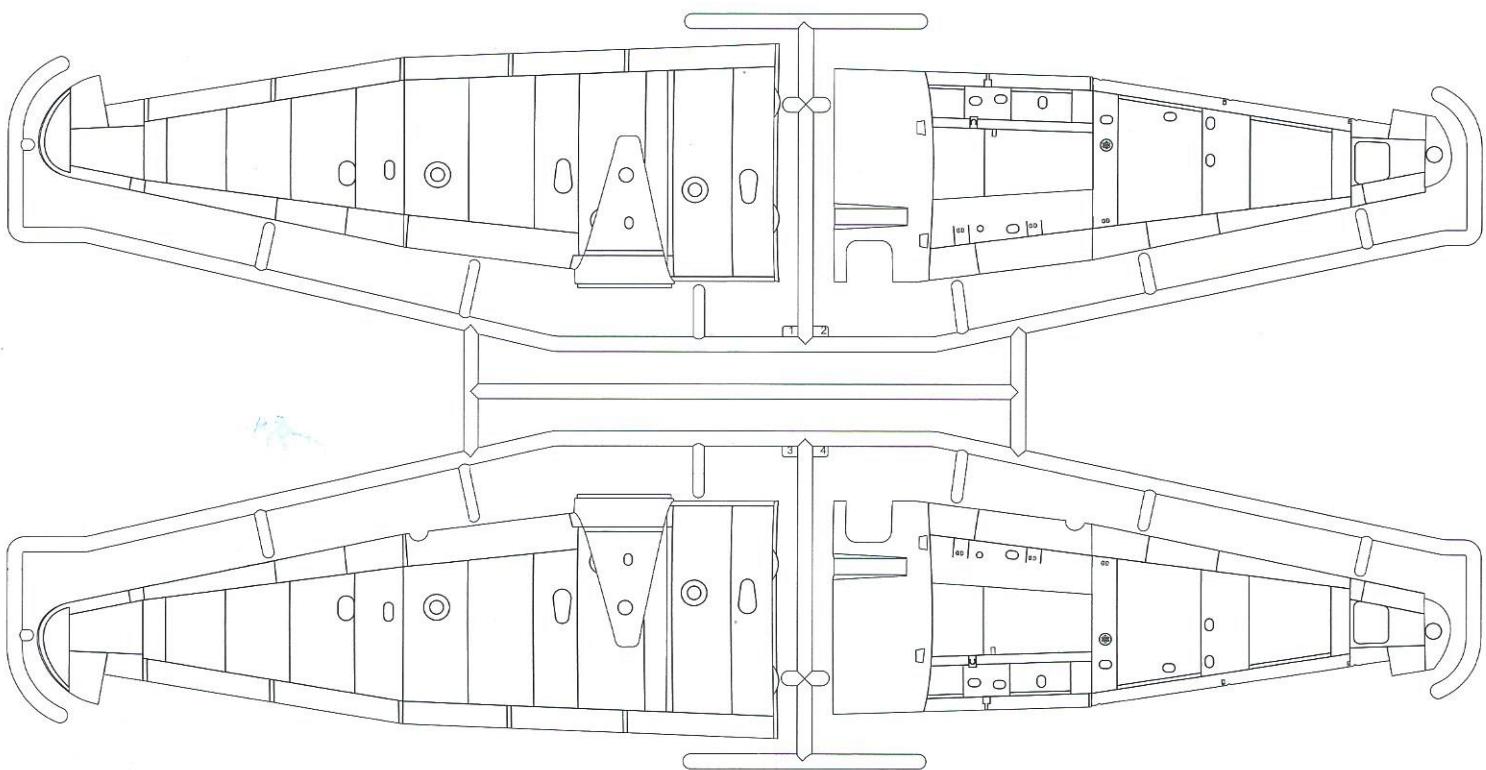

The development of the Ju 88 type was commenced as early as in 1935 to requirements of the Reichsluftfahrtministerium (Reich's Ministry of Aviation), the prototype Ju 88V-1 being taken aloft in 1936. From the beginnings, the type was meant to serve as a fast bomber aircraft. The development was rather long, the test machines designated the Ju 88A-0 being delivered to the test unit known as Erprobungskommando 88 in spring 1939. The first production batch of Ju 88A-1 machines featured a shorter span wing while all the later versions were fitted with standard, longer span wings. The A-4 version was also equipped with more powerful Jumo 211 engines. Soon it became clear that the design is rather versatile and could be very easily adapted for various purposes. Several versions were produced, depending on various service requirements, these being the bomber variant, day or night fighter, attack and anti-tank version and at last but not least the reconnaissance type. The suitability of the latter was verified by the Luftwaffe during the trials with several airframes known as the Ju 88A-5(F) and Ju-88D-0 which had the provision to carry photographic cameras in the bomb bay rear section, extra fuel tanks in the front bomb bay and also had their speed brakes removed from beneath the wing. The Ju 88A-5 airframes served as a basis for the dedicated recce versions of Ju 88 D-2 and D-4, the latter being adapted for service under tropical conditions. Both these subvariants served with recce units where they usually replaced the earlier Do-17 type. The Luftwaffe made use of their recce Ju 88Ds both in the east and west on all fronts from the Arctic Circle to the deserts of Africa. The recce Ju 88Ds were also delivered to German allies namely Rumania and Hungary. Both these satellites saw the Ju 88s operated on the Eastern Front, following the Rumania's changeover to the Allies, her Junkers airplanes were also put into action against the Wehrmacht. Handful of Junkers airframes were also captured and test-flown by the Allies.

Span: 20.08 m, Length: 14.39 m, Max. Speed: 470 km/h, Ceiling: 8 200m, Range: 1790 km
