

1/48 scale Detailed engine for Airfix Sea Fury kit

This engine sets offers quite a lot of detail and was designed to make it as easy as possible to get a little extra detail to the front end of your Sea Fury.

To try and keep the process simple the main part has now been cast as one part and not two.

Firstly cut the casting ring off the rear exhaust cover ring, this locates to the fuselage in the same way as the original kit part does. The detailed engine part has small location points that will locate into the same slots that are provided for the exhausts slot into, this will give the correct orientation for the engine.

line the top and bottom hinge points on the centre line, however note the top one has the square detail at rear the lower one at the front.

The forward cowling ring supplied in the kit is added to the front, however I would suggest that the locating 'pegs' on the inside are removed before assembling.

Note with a little extra work the doors could be closed as shown, obviously there are many options one side closed, top or bottom half closed etc.

NOTE small doors are at the top the larger doors are at the bottom, there is a small amount of flash to be removed between each hinge point to allow for assembly.

NOTE the thin section on the panel closure line, where the toggle clips close the panels together, DO NOT remove the thin backing area as these are present on the cowling.

NOTE I have supplied extra little toggle blocks, IF the cowling is displayed open, these hang down from the lower door.
