

1/48 scale Gun Sight and Light Set for Airfix Sea Fury kit

This set was done as the kit does not provide these features at all or very well, i.e. the lights are only represented by decals.

The gunsight just needs to be removed from the casting block, a smack groove filed into the thicker area at the top of the instrument panel and then just glue it on.

In reality there are some more details around this area but due to the scale and the very enclosed cockpit I elected to keep it simple.

The light installation needs the 'egg' shaped areas to be removed as shown, this is my method, drill a few holes and then use a blade to clear out to the shape required.

Note the inside of the wing can be thinned and made a little flatter to enable the lights to fit better. Note the inside of the light holder are in the 'primer / interior colour' a yellow / green colour.

Note the PORT light is the single light and has a yellow or clear colour to it.

Note the STARBOARD lights are the double lenses, they are slightly offset to the to the wing tip, the forward light is green, the rear light is red.
