

RRR48161

1/48 SCALE BEAUFIGHTER OIL COOLER DETAIL SET FOR THE TAMIYA KIT

Drill a 0.016in/Number 78 Drill hole vertically through the replacement oil coolers (for kit part D10) so that it is central in the horizontal vanes. See photograph number. Lightly countersink each end of the hole and glue a length of 0.015in wire in place and then fill the holes. Paint it Dull Aluminium internally and then carefully glue the new radiator mesh to its backing disc and install it behind the vanes. Attach this assembly to the wing. Note: when painting the model, mask the front of this part with a disc of paper to prevent the paint changing the colour of the brass radiator.
