

Dangerboy Hobbies F4F Wildcat Wing Fold Conversion Set

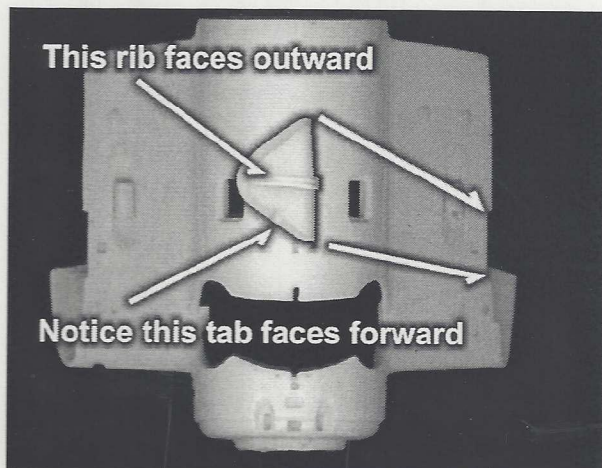

Complete steps 1, 2 and 3 per Tamiya kit instructions. Insert Heat Exchanger assembly into the wing center section. Take a few minutes to test fit the resin center section into the completed fuselage assembly. Some trimming of Tamiya part B10 may be necessary to accommodate the kit motor as well as the resin center section. This is also good time to determine how much, if any, 'creative plumbing' you want to add.

Assembled Heat Exchanger / Center Section

When assembling the model make sure the motor fits flush against the front of the resin center section. The cowling must be able to fit over the finished assembly. **Fit twice, trim once!**

When the resin center section fits to your satisfaction, mount it to the fuselage.

Install drop panels so as to hang 85 degrees, almost straight down from the wing.

Install ailerons into the wings. The Aileron with the trim tab goes on the right wing. **Both** ailerons should be displaced toward the top surface of the wing. As per the photograph above.

Install outer wings by inserting D shaped lug into the D shaped receptacle on the center wing leading edge section.

Warning: kit contains small parts that can cause choking if ingested. Not recommended for small children. Always wear eye protection and a dust filter when working with resin products.
