

INSTRUCTIONS.

To cut the canopy away from its surrounding start first with a new blade in your modelling knife. Don't attempt to cut the canopy out in one go - start by a very gentle score around the edge at a 45° angle and then use the resulting groove to slowly increase the pressure of the knife. If you try scoring too heavily too soon you risk the knife blade slipping and ruining the canopy or dripping blood on your shoes!

The canopy should then just pop out and the edge made smooth by a gentle sanding with fine wet-n-dry. To attach the canopy to the model we recommend using only white glue. Normal tube glue will not work and the vapour from super-glue can cloud the canopy.
