1/48 North American Bronco Open Canopy instructions for ICM kits

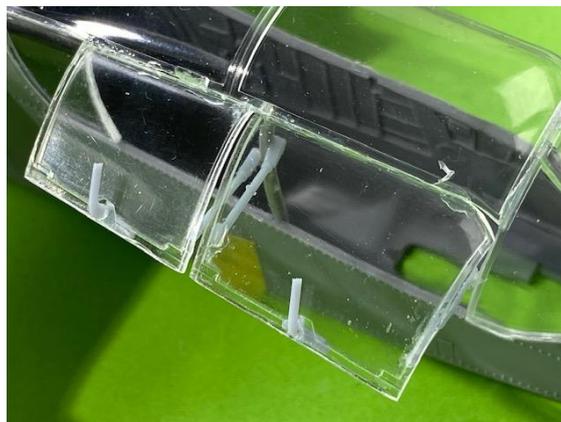

Parts included in the set, take care in removing the parts from the support bases. More 3D printed parts are included than shown.

I have removed the wipers in most cases to aid in packaging.

Note there are some options for the supports for the canopies. There are two full sets to allow the canopies on both sides to be fully opened. However in most cases seen in pictures the openings on the port side are usually opened as wide as those as those on the starboard side. So that is why the short supports are included.

Position and direction of internal latches, although this is shown on the open canopy sections, the same applies for the closed canopy.

The handles on the kit parts will need to be carefully removed and the printed handles glued in the same positions.

To assemble the 3D printed parts to the kit parts, super glue would be suggested.

A few pictures 'borrowed' show some of the details mentioned above. It is suggested you decide the position that you would like to position the open sections and select the best position for the struts. I would suggest using PVA glue but a super glue could also be used. Note super glue will not 'bloom' the clear resin the same way it does injection plastic parts.
